and key untuk tomb raider 2013.When is diabetes in pregnancy diagnosed? A systematic review. To summarise the available literature on the timing of diagnosing gestational diabetes (GDM) and type 2 diabetes mellitus (T2DM) in pregnancy. Electronic databases were searched from inception until March 2019. Data were extracted by one reviewer and verified by a second. Where data were not reported, authors were contacted. Data extraction and synthesis were performed by two reviewers, independently. A total of 13 studies met the inclusion criteria, involving 4,996 women. All studies were observational or cohort studies. The majority of studies used the Carpenter and Coustan criteria for diagnosis of GDM, with one study using the International Association of Diabetes and Pregnancy Study Groups criteria. For T2DM diagnosis, the studies used a variety of criteria. The timing of diagnosis of T2DM in pregnancy varied widely across studies. While most studies diagnosed T2DM at gestational week 24, a few studies reported the timing of T2DM diagnosis varied, and many of these cases were diagnosed after the second trimester of pregnancy. Currently, there is no consensus on the optimal timing of diabetes diagnosis during pregnancy. It is likely that the diagnosis of gestational diabetes is missed due to lack of awareness among clinicians, whereas the diagnosis of pregestational diabetes is often missed due to lack of screening. Greater awareness among women, obstetricians and diabetologists is needed to optimise detection and diagnosis of diabetes in pregnancy.# Copyright (c) 2013 The Chromium Authors.
